Flocking Home

RyannBarromaLLCC/CSC170

"Flocking Home" is a Greenfoot game. It is a side-scrolling game of leading the flock home and saving them from the enemy hawks. The lead bird steers the flock vertically to avoid colliding and being captured by the enemy hawks on their way home to their nest. This game would consist of three actors. They are the lead bird, follower birds, and the enemy hawk. The player will mainly experience the following events: a hawk captures a follower bird, a hawk captures the lead bird, increase of difficulty by spawning more hawks at random locations and velocities, and the arrival of the birds in the nest. The player would have 15 birds, 14 followers and a single lead bird. The name of the game is **survival**. Enemy hawks would spawn to capture the birds. The score is the survival rate of the flock and would update on the screen each time a hawk captures a follower bird. It is expected that the lead bird would reach the end. If captured, it is game over. If the follower bird count drops to zero before reaching the end, it is game over. If the count of the follower bird upon reaching the nest is at 5 or fewer birds (< 40% survival rate) the game would be recognized as a failure. The player wins by reaching the nest with 40% survival rate.

The lead bird is what the player will be controlling. Using bluecarrot16's "[LPC] Birds", I'll be using a sprite sheet that can be recognized as a bluejay. The formation of the lead bird and the follower birds would be in a sideways pyramid. The lead bird would be the one flying at the front of the formation. It can be controlled by the player up or down to control the rest of the flock away from the collision line flying by the enemy hawks where they can be captured. The game ends immediately when the hawk captures the lead bird.

The follower bird will be in columns of 2, 3, 4 and 5. Each time the lead bird moves, the follower birds will move in a staggered way so that 2, 3, 4 and 5 columns will not move at the same time adding complexity to the movement of the player. The follower bird can be perceived as brown birds in the similar style of the lead birds from blueccarrot's work. The formation of the birds with the lead bird will be in a sideways pyramid. Each time a hawk collides or "captures" a follower bird, the score or the survival rate will decrease by 1.

The hawks are going to be shown as bald eagles. Using bluecarrot16's "[LPC] Birds". The hawks will be appearing at the right edge at a random time and heights. Each hawk's purpose is to collide with a bird to capture them. Their flight path will fly horizontally and diagonally in increasing velocities.
